

Handling and packing

The industrial production of food poses a variety of logistics problems. Besides the equipment used in the actual production process, process steps such as transfers, material handling and packaging must also be optimised. This requires specialised knowledge. KASAG Swiss engineers have developed a range of specialised equipment with you in mind.

Bag gassing chambers

Bag gassing chambers are used for the sterile ceiling of products in bags. To do this, the air in the chamber is removed (vacuum), and nitrogen is then inserted. The equipment complies with the strictest hygiene requirements. The mounting bracket can be easily adjusted to the size of the bags.

Glovebox

Glovebox is used to perform manipulations and checks during sterile processes. This glove box with introducer sheath comes with a vibrating sieve and is used to fill sacks with powder products in a protective atmosphere.

Container tilting station

This double-tilting station with integrated weighing scale guarantees the easy handling of containers. This ensures that residual product in the container is kept to a minimum.
